by James Clark. www.mopartsracing.com. An automobile voltage regulator controls the voltage produced by the car's alternator to recharge the battery. The regulator forces the alternator to maintain a voltage of between 13.5 volts and 14.5 volts. This is sufficient to recharge the battery safely while protecting the electrical circuits and components of the car, including the wiring system, lights, motors that drive power accessories and stereo.

Voltage Regulation The voltage regulation prevents damage to the batteries and the electrical equipment on the boat, so the alternators are equipped with a voltage regulator. Nowadays they are electronic and are built into the alternator itself. The brushes and their holder are often mounted on modern voltage regulators.

A voltage regulator controls the alternator voltage output to maintain a preset charging voltage for the battery. It also controls electrical power to the vehicle's different electrical systems. Without a voltage regulator, an alternator may put out up to 250 volts. This is enough to destroy the car's battery and electrical system.

A tractor's regulator takes the voltage provided by the battery, manages it by reducing it, and sends it on to the alternator or generator at a constant volume that the alternator sends on to the coil. There are three wires that must be connected to the correct regulator terminal. Step 1 Weld the regulator mount to the tractor frame.
