This book constitutes the refereed proceedings of the 9th International Conference on Principles and Practice of Constraint Programming, CP 2003, held in Kinsale, Ireland in September/October 2003. The 48 revised full papers and 34 revised short papers presented together with 4 invited papers and 40 abstracts of contributions to the CP 2003 doctoral program were carefully reviewed and selected from 181 submissions. A wealth of recent results in computing with constraints is addressed ranging from foundational and methodological issues to solving real-world problems in a variety of application fields.

iLogic enables rules-driven design, providing a simple way to capture and reuse your work. Use iLogic to standardize and automate design processes and configure your virtual products. iLogic functions iLogic embeds rules as objects directly into part, assembly, and drawing documents. The rules determine and drive parameter and attribute values for your design. By controlling these values, you can define behavior of the attributes, features, and components of a model. Knowledge is saved and stored directly in the documents, like how geometric design elements are stored. iLogic rules can utilize custom parameter types now available in Inventor, such as text, true/false, and multi-value lists. You can use these parameter types to write rules that involve more than numeric input values. The Inventor Parameters dialog box supports these specialized parameters, with advanced filtering functions to assist in parameter input definition, management, and editing.
