prestressed concrete structures. It is shown that partial prestressing, together with supplemental nonpre-stressed reinforcement, offers a better solution (as compared to fully pre-stressed sections) with regard to di-mensioning and shaping of members, simplification of reinforcement, de-flection and crack control, and redistribution of stresses.

A 250 mm square, 15 m long prestressed concrete pile (f<sub>c</sub> = 40 MPa) was driven at a site in Amsterdam as described by Heijnen and Jansen (1985). A conventional load test conducted 31 days later produced the load-settlement curve shown in Figure.
