Propagation Engineering in Radio Links Design

Radio propagation is the behavior of radio waves as they travel, or are propagated, from one point to another, or into various parts of the atmosphere. (p261) As a form of electromagnetic radiation, like light waves, radio waves are affected by the phenomena of reflection, refraction, diffraction, absorption, polarization, and scattering.

Radio propagation - Wikipedia

Line-of-sight is the direct propagation of radio waves between antennas that are visible to each other. This is probably the most common of the radio propagation modes at VHF and higher frequencies. Because. radio signals can travel through many non-metallic objects, radio can be picked up through walls.

6 Radio Propagation Mechanisms □ The physical mechanisms that govern radio propagation are complex and diverse, but generally attributed to the following three factors 1. Reflection 2. Diffraction 3. Scattering □ Reflection □ Occurs when waves impinges upon an obstruction that is much larger in size compared to the wavelength of the signal □ Example: reflections from earth and ...

Lower frequency radio waves, below 3 MHz, travel efficiently as ground waves. In ITU nomenclature, this includes (in order): medium frequency (MF), low frequency (LF), very low frequency (VLF), ultra low frequency (ULF), super low frequency (SLF), extremely low frequency (ELF) waves. Ground propagation works because lower-frequency waves are more strongly diffracted around obstacles due to ...
