It stays matted and is less apt to be disturbed by winds and blowers. Although bark and shredded wood are great choices, the breakdown of carbon can rob the soil of valuable nitrogen. Fertilize accordingly. Create shelf-like basins around trees and shrubs that are planted into the slope and use varying sizes of rocks for stability and attractiveness.

15.1 Factors That Control Slope Stability. Mass wasting happens because tectonic processes have created uplift. Erosion, driven by gravity, is the inevitable response to that uplift, and various types of erosion, including mass wasting, have created slopes in the uplifted regions. Slope stability is ultimately determined by two factors: the angle of the slope and the strength of the materials on it.
