a proportionate increase in power. Engines burn air and fuel at an ideal (stoichiometric) ratio of about 14.7:1, which means that if you burn more air, you must also burn more fuel. This is particularly useful at high altitudes: thinner air has less oxygen, reducing power by around 3% per 1,000 feet above sea level, but a supercharger can compensate for that loss ...

Supplying high pressure air to the engine is known as supercharging. And the supercharger is used to supercharge the engines. The supercharger may be driven directly by engine of output shaft through some gears or it is driven by the exhaust gas driven turbines called Turbocharger. The various supercharging arrangements generally used are as under:

Basically supercharging means supplying high pressure air to the engine. When the high pressure air is supplied to the engine, the mass flow rate of fuel also increases and consequently it results in more power output. Hence the efficiency of the engine also increases. So, the output power developed by the engine mainly depends upon:

How are The Superchargers Invented? Since the invention of the internal combustion engine(IC engine), automotive engineers and race car designers have been searching for new ways to boost engine power and make it faster.. One way is to build a bigger engine to add more power. But bigger engines means more weight and more cost to build and maintain, and they are not always better.
