Theories of light. In the seventeenth century two rival theories of the nature of light were proposed, the wave theory and the corpuscular theory. The Dutch astronomer Huygens (1629-1695) proposed a wave theory of light.

Synopsis Quantum electrodynamics - or QED for short - is the 'strange theory' that explains how light and electrons interact.

Thanks to Richard Feynman, it is also one of the rare parts of physics that is known for sure. In this lucid set of lectures, Feynman provides the definitive introduction

The concept of light in color theory is entirely different, where mixing is additive rather than subtractive. As such, color mixing takes on an entirely different form when it comes to lighting.

The 'Corpuscular theory of light was proposed by Newton in 1704. In this theory, he successfully explained the nature of light. The corpuscular theory is the simplest theory of light in which light is assumed as the tiny particles called 'corpuscles'.
