Theoretical Approaches To Biological Control

Historically, biological control has largely been used on a trial-and-error basis, and has failed more often than it has succeeded. However, by developing theories based on fundamental population principles and the biological characteristics of the pest and agent, we can gain a much better understanding of when and how to use biological control.

theory, biological control will continue to rely on ad hoc procedures based mainly on inadequately documented past experiences (May and Hassell 1988). The actual role of theory in biological control practice While theoretical development holds promise for biological control, it has produced little of practical value in the past.

Theoretical contributions to biological control success

Classical biological control is the dominant form of biological control, being suitable for use on thousands to millions of acres of land and is a critical tool in controlling the ecological and economic damage caused by invasive pests. It is a government-supported activity for the public good and is based in ecology and population dynamics.

Natural Controls. Classical Biocontrol. Natural enemies, as well as a number of other factors, play an important role in regulating plant populations in their native environments. The absence of natural enemies may be an important contributing factor to the invasiveness of some nonnative species. Biological control (or biocontrol) reunites invasive plants with their enemies to restore natural controls and reduce dominance of invasive plants within the plant community.

John Money ' s (1972) theory was that once a biological male or female is born, social labeling and differential treatment of boys and girls interact with biological factors to steer development. This theory was an attempt to integrate the influences of nature and nurture. Gender role preferences determined by a series of critical events:

Biological processes are those processes that are vital for an organism to live, and that shape its capacities for interacting with its environment. Biological processes are made of many chemical reactions or other events that are involved in the persistence and transformation of life forms. Metabolism and homeostasis are examples.. Regulation of biological processes occurs when any process is ...

Systems biology is the computational and mathematical analysis and modeling of complex biological systems. It is a biology-based interdisciplinary field of study that focuses on complex interactions within biological systems, using a holistic approach (holism instead of the more traditional reductionism) to biological research. When it is crossing the field of systems theory and the applied ...
