This book describes the tremendous progress that has been made in the development of gas separation membranes based both on inorganic and polymeric materials. Materials discussed include polymer inclusion membranes (PIMs), metal organic frameworks (MOFs), carbon based materials, zeolites, as well as other materials, and mixed matrix membranes (MMMs) in which the above novel materials are incorporated. This broad survey of gas membranes covers material, theory, modeling, preparation, characterization (for example, by AFM, IR, XRD, ESR, Positron annihilation spectroscopy), tailoring of membranes, membrane module and system design, and applications. The book is concluded with some perspectives about the future direction of the field.

This is the first book on physicochemical hydrodynamics that is devoted to capillary systems (surface layers, drops, films, jets, etc.) whose flow is greatly influenced by surface phenomena. Two- and three-dimensional hydrodynamics and rheology are formulated, as well as the kinetics and dynamics of surfactant adsorption in capillary systems. A new approach is elaborated for describing the most complicated capillary systems, like foams and polyhedral emulsions, as continuous media. The stability of disperse structures and the influence of gravity are also analysed. Although the book is purely theoretical, many consequences of practical importance are obtained. It will be of interest to university lecturers and postgraduates in colloid and surface science, as well as researchers and engineers dealing with capillary systems. Contents: Basic Concepts of Capillarity Kinetics of Adsorption Under Condition of Flow Fundamentals of Rheology Dilatational Rheology of Surface Layer with Soluble Surfactants Hydrostatics of Capillary Systems Fundamentals of Three-Dimensional Hydrodynamics Some Simplest Problems of Hydrodynamics of Capillary Systems Capillary Waves Breakup of Capillary Jets Quasi-Two-Dimensional Hydrodynamics of Free Films Description of Polyhedral Disperse Systems in Terms of Continuum Mechanics Hydrodynamics of Stable

Foams and Highly Concentrated EmulsionsHydrodynamic Stability of Disperse SystemsHydrodynamics of Spontaneous Destruction of Polyhedral Disperse Systems with Unstable Films Readership: University lecturers and postgraduates in colloid and surface science, as well as researchers and engineers dealing with capillary systems.

This book extensively reviews the dairy, beverage and distilled spirits applications of membrane processing techniques. The four main techniques of membrane filtration are covered: microfiltration, ultrafiltration, nanofiltration and reverse osmosis. The book is divided into four informal sections. The first part provides an overview of membrane technology, including the main scientific principles; the major membrane types and their construction; cleaning and disinfection; and historical development. The second part focuses on dairy applications including liquid and fermented milks; cheese; whey; and milk concentrates. The third part of the book addresses beverage applications including mineral waters, fruit juices and sports drinks, and the final part looks at membrane filtration in the production of beers, wines and spirits.

By examining the institutions of government through the lens of constitution-making, *Crafting Constitutional Democracies* provides a broad and insightful introduction to comparative politics. Drawn from a series of lectures given in Jakarta, Indonesia, on the drafting of the U.S. constitution, the book illustrates the problems faced by generations of founders, through numerous historic and contemporary examples. Both Indonesia in 1999 and the United States in 1789 faced the same basic issue: how to construct a central government for a large and diverse nation that allowed the majority of the people to govern themselves without intruding on the rights of minorities. What kinds of institutions make for 'good government'? What factors need to be considered in designing a government? Author Edward Schneier explores these questions through a rich variety of examples from both recent and historic transitions to democracy. Drawing frequently upon the arguments of the American Federalist Papers and more contemporary theories of democratization, *Crafting Constitutional Democracies* lucidly explores the key questions of how and why democracies succeed and fail. A concluding chapter on constitutional change and decline raises provocative and important questions about the lessons that citizens of the world's older democracies might take from the struggles of the new.

This technology, though used for many years, has shown great vitality recently and is still in a state of flux. Provides an account of developments up to the present and also an orderly evaluation of literature already published on the subject. Considerable space is devoted to bubble column reactor performance predictions based on mathematical models and the importance of each is explained with practical examples.

This work describes the different operational regimes and the dominant mechanisms of flows in disperse systems.
